

ABSTRACT

A urethral suppository comprising a non-melttable base member sized to prevent insertion of the base member into the urethra, a non-melttable reinforcement projecting from the base member, and a melttable portion formed around a portion of the reinforcement. The melttable portion tapers along the reinforcement and is shaped for cooperating with the action of the periurethral musculature to retain the suppository within the urethra. A method of delivering one or more therapeutic agents to the female urinary tract, the method involving insertion of the urethral suppository into the urethra. A method for manufacturing a reinforced urethral suppository.
